**To: All Bellshill Pipeline Shippers and Producers**

**Re: Elimination of Batching Service on the Bellshill Pipeline**

Please be advised that, effective August 1, 2010, the Bellshill Pipeline will no longer provide crude oil batching service for deliveries into the Gibson Hardisty Terminal. This action is required as a result of a continued decline in the volumes being delivered to the pipeline. The reduced flow rate has resulted in laminar flow in the pipeline and, as a result, batch integrity cannot be maintained.

For the majority of the past year the stream carried on the Bellshill Pipeline has delivered into the Bow River stream at Hardisty. Also, the majority of the receipts into the Bellshill Pipeline are heavier than 889.0 kg/m<sup>3</sup>, the quality threshold for the Hardisty Light Sour stream. Consequently, receipts into the Bellshill Pipeline will be delivered into the Bow River stream only.

If in the future there are material changes in the quantity or quality of production on the Bellshill Pipeline, Gibson will reevaluate its position with respect to batching or the designation of the stream this pipeline is delivered into.

If you have any questions, please don't hesitate to contact the undersigned at 403.206.4084.

Sincerely,

Gibson Energy Partnership
